PROFILE

Senior full-stack and backend engineer who owns operational products from data modeling and API design through accessible interfaces and production delivery. At DeliverZero, built inventory, returns, and partner integration workflows across three markets, reducing manual operational work by approximately 25%. Current independent work spans deployed Go and Python services, PostgreSQL and search, privacy-aware social products, self-hosted automation, and a Unity client.

CORE TECHNOLOGIES

Backend: Go, Python, TypeScript, PostgreSQL, PostGIS, Redis, OpenSearch, REST APIs, asynchronous jobs

Product: React, TypeScript, React Native/Expo, Unity/C#, Tailwind CSS, MapLibre, accessibility, search and retrieval

Delivery & Quality: Docker, Kubernetes, CI/CD, migrations, observability, Playwright, load testing, privacy by design

EXPERIENCE

DeliverZero

Chicago/NYC/Denver

Full-Stack Engineer

2022-2023

- Built tracking, returns, inventory, and dashboard workflows supporting launch and operations across LA, New York, and Denver through delivery platform, POS, REST API, and partner integrations.
- Built replenishment monitoring, exception routing, self-service partner workflows, and operational dashboards, reducing manual work by approximately 25%.
- Designed idempotent integration and reconciliation workflows with retries, observability, lifecycle state models, and partner test harnesses to process thousands of weekly inventory and customer-status updates.
- Delivered reporting for internal teams and partners, including reuse-impact and water, waste, and emissions metrics.

SELECTED INDEPENDENT WORK

Subcult.tv

Chicago

Independent Full-Stack / Backend Engineer

2023-Present

- **clpr.tv**—Built and operate a deployed Twitch discovery platform with a Go API, React client, PostgreSQL, hybrid semantic and keyword search, queue-backed processing, and moderation and audit controls.
- **HasanAra.tv**—Built and deployed a citation-first video research platform with FastAPI, React, GPU-backed transcription and enrichment, durable ingestion jobs, PostgreSQL, and OpenSearch with database fallback.
- **Patchwork**—Built an AT Protocol-native mutual-aid prototype with privacy-preserving geospatial discovery, real-time ingestion and indexing, durable chat and coordination workflows, moderation, and browser-tested accessibility.
- **Subcults**—Built a privacy-first platform for discovering local music scenes, artists, events, tours, and live audio, using a Go API, React and MapLibre, PostGIS, AT Protocol records and synchronization, and WebRTC.
- **Subcult-OS**—Built a full-stack operations platform for independent cultural organizations, spanning multi-workspace membership, public events and ticketing, mobile door check-in, staffing workflows, and end-of-night reporting across Go, React, Expo/React Native, and PostgreSQL.
- **Clustr/Clustr-Galaxy**—Built a Reddit community graph pipeline with Go, PostgreSQL, community detection, and interactive 2D/3D visualization, then created a Unity 6 exploration client with revision-pinned APIs, deterministic survey gameplay, local progression, and offline Linux builds.
- **SwitchYard**—Built and deployed a self-hosted automation runtime for durable workflows, model routing, coding-agent execution, and operator controls, with a Go API, React dashboard, PostgreSQL queues, policy-gated actions, observability, and release qualification.
