PROFILE

Senior full-stack and backend engineer with professional experience delivering operational web products, APIs, dashboards, and partner integrations across three markets. Builds accessible React and TypeScript interfaces backed by reliable services, PostgreSQL data models, asynchronous workflows, CI/CD, and explicit quality gates. Owns features end to end and turns complex operational requirements into usable, supportable tools.

CORE TECHNOLOGIES

Frontend & UX: React, TypeScript, Tailwind CSS, Playwright, accessible interfaces, accessibility and visual-regression testing

Backend & APIs: Go, Python, TypeScript, SQL, REST APIs, async jobs, task queues, stateful workflows

Data & Integrations: PostgreSQL, Redis, data modeling, migrations, partner integrations, reconciliation, reporting

Delivery & Quality: Docker, Kubernetes, GitHub Actions, CI/CD, observability, load testing, privacy by design

AI Product: RAG, retrieval workflows, embeddings, pgvector, structured outputs, tool/function calling, Whisper

PROFESSIONAL EXPERIENCE

DeliverZero | Chicago / NYC / Denver

2022-2023

Full-Stack Engineer

- Led tracking, returns, inventory, and dashboard features supporting launch and scale across three markets through delivery-platform, POS, REST API, and partner integrations.
- Built replenishment monitoring, exception routing, self-serve partner workflows, reporting systems, and dashboards, reducing manual operational work by approximately 25%.
- Defined integration standards for idempotency, retries, observability, partner test harnesses, lifecycle state models, reconciliation jobs, and failure handling across high-volume workflows.
- Developed backend data models and reconciliation jobs processing thousands of weekly inventory, container-lifecycle, customer-status, POS, delivery, and internal-system updates.
- Delivered analytics and reporting across operational dashboards, surfacing reuse-impact and water, waste, and emissions metrics for internal teams and partners.

SELECTED INDEPENDENT ENGINEERING

Subcult.tv | *Self-directed project* | Chicago

2023-Present

Independent Full-Stack / Backend Engineer

- Built accessible React/TypeScript workflow interfaces and automated checks for accessibility, performance, visual regression, load, privacy, and security behavior.
- Designed and built multi-service prototypes using React, Go, TypeScript, Python, PostgreSQL, Redis, Docker, and AT Protocol for data ingestion, discovery, creator workflows, and real-time collaboration.
- Prototyped AI workflows for search, transcription, metadata enrichment, and structured content preparation using retrieval, pgvector, embeddings, Whisper, structured outputs, and tool/function calling.
- Implemented async-job, task-queue, retry, idempotency, reconciliation, and stateful-workflow patterns across prototype services and human-in-the-loop review paths.
- Built backend patterns for data inventory, metadata enrichment, search, retrieval, migration, and long-term access across multiple prototype services.
- Created containerized development and deployment patterns with GitHub Actions CI/CD, automated migrations, Vault-backed secrets, Prometheus/Grafana monitoring, alerting, documentation, and runbooks.
